In collaboration with Giovanni Salmè

Based on:

Eur.Phys.J.C 81 (2021) 1, 34

- Rather technical talk as I was asked to speak specifically on our last paper
→ I try to make it as lively as possible
- For a review of application to observables, see *e.g.* P. Maris talk in December and topical review article on DSE-BSE
- I tried to come back on some points mentioned during the discussion following P. Maris talk (I could not attend to)

Introduction

- Perturbation theory: a powerful tool to describe scattering in QFT
 - ▶ anomalous magnetic moment of the electron (multi-loop pQED)
 - ▶ structure functions scaling violations (major pQCD result)

- Perturbation theory: a powerful tool to describe scattering in QFT
 - ▶ anomalous magnetic moment of the electron (multi-loop pQED)
 - ▶ structure functions scaling violations (major pQCD result)
- *but* some phenomena escape a perturbative description:

 - ▶ Lightfront Hamiltonian
 - ▶ ADS/QCD
 - ▶ Lattice QCD
 - ▶ Dyson-Schwinger/Bether Salpeter equations

DSEs relate the N -point functions of a given QFT among each other.

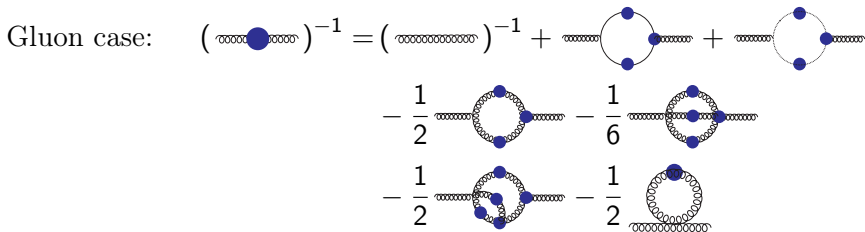

Quark case: $(\text{---}\bullet\text{---})^{-1} = (\text{---}\text{---})^{-1} - \text{loop diagram}$.

Ghost case: $(\text{---}\bullet\text{---})^{-1} = (\text{---}\text{---})^{-1} + \text{loop diagram}$.

Gluon case: $(\text{wavy}\bullet\text{wavy})^{-1} = (\text{wavy}\text{---}\text{wavy})^{-1} + \text{tree diagrams} + \text{loop diagrams}$.

Coupled to higher N -point functions \rightarrow infinite set of equations

- 3-point functions also obey their own DSEs:

- 3-point functions also obey their own DSEs:

- Higher point functions present poles at bound-states masses
 → residues yield the Bethe-Salpeter wave functions

- 3-point functions also obey their own DSEs:

- Higher point functions present poles at bound-states masses
→ residues yield the Bethe-Salpeter wave functions

- DSE-BSE formalism provides a way to study bound states
- Approximations are required to close the system (truncations)

- Usually, DSE-BSE are solved numerically in Euclidean space
 - ▶ External momenta are continued in the complex plane
 - ▶ Can reveal itself numerically challenging
 - ▶ A direct access to lighfront quantities can be difficult

- Usually, DSE-BSE are solved numerically in Euclidean space
 - ▶ External momenta are continued in the complex plane
 - ▶ Can reveal itself numerically challenging
 - ▶ A direct access to lightfront quantities can be difficult
- Attempts to solve the DSEs in Minkowski space remain scarce

V. Sauli J. Phys. G30, 739 (2004)

S. Jia and M.R. Pennington, Phys. Rev. D96(3), 036021(2017)

E. Solis *et al.*, Few Body Syst.60(3), 49 (2019)

V. Sauli, aXiv:1909.03043

Our idea

Can we “export” to Minkowski space the theoretical progresses achieved in euclidean one?

Two-point functions in Minkowski space

- Abelian DSE are much simpler than QCD ones:

Fermion case: $(\text{---}\bullet\text{---})^{-1} = (\text{---}\text{---})^{-1} - \text{[loop diagram]}$

~~Ghost case: $(\text{---}\bullet\text{---})^{-1} = (\text{---}\text{---})^{-1} + \text{[loop diagram]}$~~

Photon case: $(\text{---}\bullet\text{---})^{-1} = (\text{---}\text{---})^{-1} + \text{[loop diagrams]}$

~~$-\frac{1}{2} \text{[loop diagram]} - \frac{1}{6} \text{[loop diagram]}$~~

~~$-\frac{1}{2} \text{[loop diagram]} - \frac{1}{2} \text{[loop diagram]}$~~

- Abelian theories presents interesting properties that can be exploited.

- Fermion Case:

$$iS_R^{-1}(p, \zeta^2) = \not{p} - m - \Sigma_R(p, \zeta^2)$$

$$\Sigma_R(p, \zeta^2) = \not{p}\mathcal{A}_R(p, \zeta^2) + \mathcal{B}_R(p, \zeta^2)$$

- Photon case in covariant gauges:

$$D_R^{\mu\nu}(q, \zeta^2) = -i \frac{T^{\mu\nu}(q)}{(q^2 + i\epsilon)(1 + \Pi_R(q^2, \zeta^2))}$$

$$T^{\mu\nu}(q) = \eta^{\mu\nu} - (1 - \xi) \frac{q^\mu q^\nu}{q^2}$$

- The Källén-Lehmann representation is a key property of the propagator:

$$S_R(p, \zeta^2) = i\mathcal{R}_S \frac{\not{p} + m}{p^2 - m^2 + i\epsilon} + i \int_{s_{th}}^{\infty} \frac{\not{p} \sigma_V(s, \zeta) + \sigma_S(s, \zeta)}{p^2 - s + i\epsilon}$$
$$D_R^{\mu\nu}(q, \zeta) = -iT^{\mu\nu}(q) \left(\frac{\mathcal{R}_D}{q^2 + i\epsilon} + \int_{s_{th}^p}^{\infty} \frac{\sigma_\gamma(s, \zeta^2)}{q^2 - s + i\epsilon} \right)$$

with \mathcal{R}_S and \mathcal{R}_D the residues at the fermion and photon poles.

- The Källén-Lehmann representation is a key property of the propagator:

$$S_R(p, \zeta^2) = i\mathcal{R}_S \frac{\not{p} + m}{p^2 - m^2 + i\epsilon} + i \int_{s_{th}}^{\infty} \frac{\not{p} \sigma_\nu(s, \zeta) + \sigma_s(s, \zeta)}{p^2 - s + i\epsilon}$$
$$D_R^{\mu\nu}(q, \zeta) = -iT^{\mu\nu}(q) \left(\frac{\mathcal{R}_D}{q^2 + i\epsilon} + \int_{s_{th}^p}^{\infty} \frac{\sigma_\gamma(s, \zeta^2)}{q^2 - s + i\epsilon} \right)$$

with \mathcal{R}_S and \mathcal{R}_D the residues at the fermion and photon poles.

- It relies on non-perturbative arguments involving:
 - ▶ asymptotic states
 - ▶ complete set states

- The Källén-Lehmann representation is a key property of the propagator:

$$S_R(p, \zeta^2) = i\mathcal{R}_S \frac{\not{p} + m}{p^2 - m^2 + i\epsilon} + i \int_{s_{th}}^{\infty} \frac{\not{p} \sigma_\nu(s, \zeta) + \sigma_s(s, \zeta)}{p^2 - s + i\epsilon}$$
$$D_R^{\mu\nu}(q, \zeta) = -iT^{\mu\nu}(q) \left(\frac{\mathcal{R}_D}{q^2 + i\epsilon} + \int_{s_{th}^p}^{\infty} \frac{\sigma_\gamma(s, \zeta^2)}{q^2 - s + i\epsilon} \right)$$

with \mathcal{R}_S and \mathcal{R}_D the residues at the fermion and photon poles.

- It relies on non-perturbative arguments involving:
 - ▶ asymptotic states
 - ▶ complete set states
- Advantages: algebraic manipulation of the momenta

- The Källén-Lehmann representation is a key property of the propagator:

$$S_R(p, \zeta^2) = i\mathcal{R}_S \frac{\not{p} + m}{p^2 - m^2 + i\epsilon} + i \int_{s_{th}}^{\infty} \frac{\not{p}\sigma_\nu(s, \zeta) + \sigma_s(s, \zeta)}{p^2 - s + i\epsilon}$$
$$D_R^{\mu\nu}(q, \zeta) = -iT^{\mu\nu}(q) \left(\frac{\mathcal{R}_D}{q^2 + i\epsilon} + \int_{s_{th}^p}^{\infty} \frac{\sigma_\gamma(s, \zeta^2)}{q^2 - s + i\epsilon} \right)$$

with \mathcal{R}_S and \mathcal{R}_D the residues at the fermion and photon poles.

- It relies on non-perturbative arguments involving:
 - ▶ asymptotic states
 - ▶ complete set states
- Advantages: algebraic manipulation of the momenta

What about self energies?

- Nakinishi representation (also called Perturbative Integral Representation -PTIR-)

see e.g. N. Nakanishi, *Graph Theory and Feynman Integrals*, Gordon and Breach 1971

- Nakinishi representation (also called Perturbative Integral Representation -PTIR-)

see e.g. N. Nakanishi, *Graph Theory and Feynman Integrals*, Gordon and Breach 1971

- It relies graph theory (studies of graph having N external legs) and exploits Feynman trick

- Nakanishi representation (also called Perturbative Integral Representation -PTIR-)

see e.g. N. Nakanishi, *Graph Theory and Feynman Integrals*, Gordon and Breach 1971

- It relies graph theory (studies of graph having N external legs) and exploits Feynman trick
- It yields the following representations:

$$Z_2(\zeta)\Sigma(p, \Lambda) = \int_0^\infty [ds]_\Lambda \frac{\not{p}\rho_A(s, \zeta^2) + \rho_B(s, \zeta^2)}{p^2 - s + i\epsilon}$$

$$Z_3(\zeta)\Pi(q, \Lambda) = \int_0^\infty [ds]_\Lambda \frac{\rho_\gamma(s, \zeta^2)}{q^2 - s + i\epsilon}$$

allowing the algebraic manipulation of the momenta.

- Nakanishi representation (also called Perturbative Integral Representation -PTIR-)

see e.g. N. Nakanishi, *Graph Theory and Feynman Integrals*, Gordon and Breach 1971

- It relies graph theory (studies of graph having N external legs) and exploits Feynman trick
- It yields the following representations:

$$Z_2(\zeta)\Sigma(p, \Lambda) = \int_0^\infty [ds]_\Lambda \frac{\not{p}\rho_A(s, \zeta^2) + \rho_B(s, \zeta^2)}{p^2 - s + i\epsilon}$$

$$Z_3(\zeta)\Pi(q, \Lambda) = \int_0^\infty [ds]_\Lambda \frac{\rho_\gamma(s, \zeta^2)}{q^2 - s + i\epsilon}$$

allowing the algebraic manipulation of the momenta.

- Such a representation is proven to hold at **all order** of perturbation theory

Advantages

- Crucially, the ρ are **unique** and **independent** of the momenta.
- Such relations can be generalised to higher N -point functions, such as the vertex function ($N=3$), the scattering amplitude ($N=4$)...

see seminar by P. Maris in December

$$\Gamma(k, P, \Lambda) = \int_{-1}^1 [dz]_{\Lambda} \int_0^{\infty} [d\beta]_{\Lambda} \frac{\rho(z, \beta)}{\beta - (k + \frac{z}{2}P)^2}$$

Advantages

- Crucially, the ρ are **unique** and **independent** of the momenta.
- Such relations can be generalised to higher N -point functions, such as the vertex function ($N=3$), the scattering amplitude ($N=4$)...

see seminar by P. Maris in December

$$\Gamma(k, P, \Lambda) = \int_{-1}^1 [dz]_{\Lambda} \int_0^{\infty} [d\beta]_{\Lambda} \frac{\rho(z, \beta)}{\beta - (k + \frac{z}{2}P)^2}$$

Drawback

- All order of perturbation theory \neq non-perturbatively
→ weaker than the “Källén-Lehmann” proof (at least in Abelian case)
However:
 - ▶ assume that the Nakanishi representation hold non-perturbatively
 - ▶ price to pay might be that ρ are not smooth functions

- Previously used for the self-energy through direct computations

V. Sauli, J. Phys., 2004, G30, 739-758

...

- And also in the case of the vertex function

We will look for a direct computation through the DSE

- Gauge Dependence : we will work in the Landau gauge

- Gauge Dependence : we will work in the Landau gauge
- Renormalisation Conditions
 - ▶ Standard on-shell scheme ($\zeta^2 = m^2$):

$$m\mathcal{A}_R(m^2, m^2) + \mathcal{B}_R(m^2, m^2) = 0$$

$$\mathcal{A}_R(m^2, m^2) + 2m \left(m \frac{\partial \mathcal{A}_R}{\partial p^2}(m^2, m^2) + \frac{\partial \mathcal{B}}{\partial p^2}(m^2, m^2) \right) = 0$$

mixes \mathcal{A}_R and $\mathcal{B}_R \rightarrow$ cumbersome for an exploratory study

- Gauge Dependence : we will work in the Landau gauge
- Renormalisation Conditions
 - ▶ Standard on-shell scheme ($\zeta^2 = m^2$):

$$m\mathcal{A}_R(m^2, m^2) + \mathcal{B}_R(m^2, m^2) = 0$$
$$\mathcal{A}_R(m^2, m^2) + 2m \left(m \frac{\partial \mathcal{A}_R}{\partial p^2}(m^2, m^2) + \frac{\partial \mathcal{B}}{\partial p^2}(m^2, m^2) \right) = 0$$

mixes \mathcal{A}_R and $\mathcal{B}_R \rightarrow$ cumbersome for an exploratory study

- ▶ RI'/MOM scheme "on-shell" ($\zeta^2 = m^2$):

$$\mathcal{A}_R(m^2, m^2) = 0 \quad \mathcal{B}_R(m^2, m^2) = 0$$

price to pay: the residue at the pole is not 1 anymore

- Gauge Dependence : we will work in the Landau gauge
- Renormalisation Conditions
 - ▶ Standard on-shell scheme ($\zeta^2 = m^2$):

$$m\mathcal{A}_R(m^2, m^2) + \mathcal{B}_R(m^2, m^2) = 0$$
$$\mathcal{A}_R(m^2, m^2) + 2m \left(m \frac{\partial \mathcal{A}_R}{\partial p^2}(m^2, m^2) + \frac{\partial \mathcal{B}}{\partial p^2}(m^2, m^2) \right) = 0$$

mixes \mathcal{A}_R and $\mathcal{B}_R \rightarrow$ cumbersome for an exploratory study

- ▶ RI'/MOM scheme "on-shell" ($\zeta^2 = m^2$):

$$\mathcal{A}_R(m^2, m^2) = 0 \quad \mathcal{B}_R(m^2, m^2) = 0$$

price to pay: the residue at the pole is not 1 anymore

- ▶ Photon case : standard $\Pi_R(\zeta_p^2, \zeta_p^2) = 0$ for ζ_p being a IR regulator

- Gauge Dependence : we will work in the Landau gauge
- Renormalisation Conditions
 - ▶ Standard on-shell scheme ($\zeta^2 = m^2$):

$$m\mathcal{A}_R(m^2, m^2) + \mathcal{B}_R(m^2, m^2) = 0$$
$$\mathcal{A}_R(m^2, m^2) + 2m \left(m \frac{\partial \mathcal{A}_R}{\partial p^2}(m^2, m^2) + \frac{\partial \mathcal{B}}{\partial p^2}(m^2, m^2) \right) = 0$$

mixes \mathcal{A}_R and $\mathcal{B}_R \rightarrow$ cumbersome for an exploratory study

- ▶ RI'/MOM scheme "on-shell" ($\zeta^2 = m^2$):

$$\mathcal{A}_R(m^2, m^2) = 0 \quad \mathcal{B}_R(m^2, m^2) = 0$$

price to pay: the residue at the pole is not 1 anymore

- ▶ Photon case : standard $\Pi_R(\zeta_p^2, \zeta_p^2) = 0$ for ζ_p being a IR regulator
- ▶ Renormalisation constant given in terms of Nakanishi weights:

$$Z_2(\zeta = m, \Lambda) = 1 + \int_{m^2}^{\infty} [ds]_{\Lambda} \frac{\rho_A(s, \zeta)}{m^2 - s + i\epsilon}$$

- Exploit our various expressions for S_R (and $D_R^{\mu\nu}$)

$$\begin{aligned} S_R(p, \zeta^2) &= \mathcal{R}_s \frac{\not{p} + m}{p^2 - m^2 + i\epsilon} + \int_{sth}^{\infty} \frac{\not{p}\sigma_\nu(s, \zeta^2) + \sigma_s(s, \zeta^2)}{p^2 - s + i\epsilon} \\ &= \frac{\not{p} (1 - \mathcal{A}_R(p^2, \zeta^2)) + m + \mathcal{B}_R(p^2, \zeta^2)}{p^2 (1 - \mathcal{A}_R(p^2, \zeta^2))^2 - (m + \mathcal{B}_R(p^2, \zeta^2))^2} \end{aligned}$$

- Exploit our various expressions for S_R (and $D_R^{\mu\nu}$)

$$\begin{aligned} S_R(p, \zeta^2) &= \mathcal{R}_s \frac{\not{p} + m}{p^2 - m^2 + i\epsilon} + \int_{s_{th}}^{\infty} \frac{\not{p} \sigma_v(s, \zeta^2) + \sigma_s(s, \zeta^2)}{p^2 - s + i\epsilon} \\ &= \frac{\not{p} (1 - \mathcal{A}_R(p^2, \zeta^2)) + m + \mathcal{B}_R(p^2, \zeta^2)}{p^2 (1 - \mathcal{A}_R(p^2, \zeta^2))^2 - (m + \mathcal{B}_R(p^2, \zeta^2))^2} \end{aligned}$$

- Using the Sokhotski–Plemelj formula for $p^2 > m^2$

$$\begin{aligned} \sigma_v(p^2, \zeta^2) &= \frac{-1}{\pi} \Im \left(\frac{(1 - \mathcal{A}_R(p^2, \zeta^2))}{p^2 (1 - \mathcal{A}_R(p^2, \zeta^2))^2 - (m + \mathcal{B}_R(p^2, \zeta^2))^2} \right) \\ \sigma_s(p^2, \zeta^2) &= \frac{-1}{\pi} \Im \left(\frac{m + \mathcal{B}_R(p^2, \zeta^2)}{p^2 (1 - \mathcal{A}_R(p^2, \zeta^2))^2 - (m + \mathcal{B}_R(p^2, \zeta^2))^2} \right) \end{aligned}$$

- Exploit our various expressions for S_R (and $D_R^{\mu\nu}$)
- Using the Sokhotski–Plemelj formula for $p^2 > m^2$

$$\sigma_v(p^2, \zeta^2) = \frac{-1}{\pi} \Im \left(\frac{(1 - \mathcal{A}_R(p^2, \zeta^2))}{p^2 (1 - \mathcal{A}_R(p^2, \zeta^2))^2 - (m + \mathcal{B}_R(p^2, \zeta^2))^2} \right)$$

$$\sigma_s(p^2, \zeta^2) = \frac{-1}{\pi} \Im \left(\frac{m + \mathcal{B}_R(p^2, \zeta^2)}{p^2 (1 - \mathcal{A}_R(p^2, \zeta^2))^2 - (m + \mathcal{B}_R(p^2, \zeta^2))^2} \right)$$

- It yields the σ as (non-linear) functions of the ρ

$$\sigma_v(p^2, \zeta^2) = F_v \left\{ \rho_A, \rho_B, PV \left[\frac{\rho_A(s, \zeta^2)}{(p^2 - s)(\zeta^2 - s)} \right], PV \left[\frac{\rho_B(s, \zeta^2)}{(p^2 - s)(\zeta^2 - s)} \right] \right\}$$

$$\sigma_s(p^2, \zeta^2) = F_s \left\{ \rho_A, \rho_B, PV \left[\frac{\rho_A(s, \zeta^2)}{(p^2 - s)(\zeta^2 - s)} \right], PV \left[\frac{\rho_B(s, \zeta^2)}{(p^2 - s)(\zeta^2 - s)} \right] \right\}$$

- Exploit our various expressions for S_R (and $D_R^{\mu\nu}$)
- Using the Sokhotski–Plemelj formula for $p^2 > m^2$
- It yields the σ as (non-linear) functions of the ρ

$$\sigma_v(p^2, \zeta^2) = F_v \left\{ \rho_A, \rho_B, PV \left[\frac{\rho_A(s, \zeta^2)}{(p^2 - s)(\zeta^2 - s)} \right], PV \left[\frac{\rho_B(s, \zeta^2)}{(p^2 - s)(\zeta^2 - s)} \right] \right\}$$

$$\sigma_s(p^2, \zeta^2) = F_s \left\{ \rho_A, \rho_B, PV \left[\frac{\rho_A(s, \zeta^2)}{(p^2 - s)(\zeta^2 - s)} \right], PV \left[\frac{\rho_B(s, \zeta^2)}{(p^2 - s)(\zeta^2 - s)} \right] \right\}$$

- This yields 3 equations in our system of 6 unknown $(\sigma_v, \sigma_s, \sigma_\gamma, \rho_A, \rho_B, \rho_\gamma)$

- Exploit our various expressions for S_R (and $D_R^{\mu\nu}$)
- Using the Sokhotski–Plemelj formula for $p^2 > m^2$
- It yields the σ as (non-linear) functions of the ρ

$$\sigma_v(p^2, \zeta^2) = F_v \left\{ \rho_A, \rho_B, PV \left[\frac{\rho_A(s, \zeta^2)}{(p^2 - s)(\zeta^2 - s)} \right], PV \left[\frac{\rho_B(s, \zeta^2)}{(p^2 - s)(\zeta^2 - s)} \right] \right\}$$

$$\sigma_s(p^2, \zeta^2) = F_s \left\{ \rho_A, \rho_B, PV \left[\frac{\rho_A(s, \zeta^2)}{(p^2 - s)(\zeta^2 - s)} \right], PV \left[\frac{\rho_B(s, \zeta^2)}{(p^2 - s)(\zeta^2 - s)} \right] \right\}$$

- This yields 3 equations in our system of 6 unknown ($\sigma_v, \sigma_s, \sigma_\gamma, \rho_A, \rho_B, \rho_\gamma$)
- 3 more are provided by the gap equations.

Abelian DSEs in Minkowski space

In Search of Lost Vertex

$$\begin{aligned}

 \end{aligned}$$

$$\begin{aligned}
 (\text{---}\bullet\text{---})^{-1} &= (\text{---})^{-1} - \text{---}\bullet\text{---}\bullet\text{---}\bullet\text{---} \\
 (\text{wavy}\bullet\text{wavy})^{-1} &= (\text{wavy})^{-1} + \text{wavy}\bullet\text{wavy}\bullet\text{wavy}\bullet\text{wavy}\bullet\text{wavy}
 \end{aligned}$$

$$\begin{aligned}
 \Sigma_R(\zeta; p) &= -iZ_1(\zeta, \Lambda) e_R^2 \int_{\Lambda} \frac{d^4 k}{(2\pi)^4} \gamma^\beta S_R(\zeta, k) \\
 &\quad \times \left\{ D_{\beta\alpha}^R(\zeta, p-k) \Gamma_R^\alpha(\zeta; k, p) - [D_{\beta\alpha}^R(\zeta, p-k) \Gamma_R^\alpha(\zeta; k, p)]_{p^2=\zeta^2} \right\} \cdot \\
 \Pi_R(\zeta; q) &= -iZ_1(\zeta, \Lambda) \frac{4}{3} e_R^2 \int_{\Lambda} \frac{d^4 k}{(2\pi)^4} \mathcal{P}_{\mu\nu} \frac{1}{4} \text{Tr} \left[\gamma^\mu S_R(\zeta, k) \right. \\
 &\quad \left. \times \left\{ \frac{1}{q^2} \Gamma_R^\nu(\zeta, k, q) S_R(\zeta, k-q) - \frac{1}{\zeta_p^2} [\Gamma_R^\nu(\zeta, k, q) S_R(\zeta, k-q)]_{q^2=\zeta_p^2} \right\} \right]
 \end{aligned}$$

The last thing to get under control is the vertex

- First thing one could look at: neglecting higher point functions:

- Independent of the momenta \rightarrow all momenta degrees of freedom of the self-energy can be algebraically manipulated
- It works well for the fermion self-energy

- First thing one could look at: neglecting higher point functions:

- Independent of the momenta \rightarrow all momenta degrees of freedom of the self-energy can be algebraically manipulated
- It works well for the fermion self-energy

Major issues

- The vacuum polarisation tensor $\Pi^{\mu\nu}$ is *not* transverse anymore
- Quadratic divergences (proportional to $\eta^{\mu\nu}$) do not vanish as they should

- Ward-Takahashi Identities are the consequence of current conservation

- Ward-Takahashi Identities are the consequence of current conservation
- They relates some N -point functions with lower N ones.

- Ward-Takahashi Identities are the consequence of current conservation
- They relates some N -point functions with lower N ones.
- In the case of the three-point function, one has:

$$\begin{aligned} (k_2 - k_1)_\mu \Gamma_R^\mu(k_2, k_1, \zeta) &= iS_R^{-1}(k_2, \zeta) - iS_R^{-1}(k_1, \zeta) \\ &= \underbrace{(k_2 - k_1)}_{\text{tree-level vertex}} - (k_2 \mathcal{A}_R(k_2) - k_1 \mathcal{A}_R(k_1)) - (\mathcal{B}_R(k_2) - \mathcal{B}_R(k_1)) \end{aligned}$$

- Ward-Takahashi Identities are the consequence of current conservation
- They relates some N -point functions with lower N ones.
- In the case of the three-point function, one has:

$$\begin{aligned} (k_2 - k_1)_\mu \Gamma_R^\mu(k_2, k_1, \zeta) &= iS_R^{-1}(k_2, \zeta) - iS_R^{-1}(k_1, \zeta) \\ &= \underbrace{(k_2 - k_1)}_{\text{tree-level vertex}} - (k_2 \mathcal{A}_R(k_2) - k_1 \mathcal{A}_R(k_1)) - (\mathcal{B}_R(k_2) - \mathcal{B}_R(k_1)) \end{aligned}$$

A tree level vertex violates the WTI \rightarrow not suitable for handling the photon

- Ward-Takahashi Identities are the consequence of current conservation
- They relates some N -point functions with lower N ones.
- In the case of the three-point function, one has:

$$\begin{aligned}
 (k_2 - k_1)_\mu \Gamma_R^\mu(k_2, k_1, \zeta) &= iS_R^{-1}(k_2, \zeta) - iS_R^{-1}(k_1, \zeta) \\
 &= \underbrace{(k_2 - k_1)}_{\text{tree-level vertex}} - (k_2 \mathcal{A}_R(k_2) - k_1 \mathcal{A}_R(k_1)) - (\mathcal{B}_R(k_2) - \mathcal{B}_R(k_1))
 \end{aligned}$$

A tree level vertex violates the WTI \rightarrow not suitable for handling the photon

Need to build a vertex fulfilling all the required symmetry properties

- Instead of using the DSE to build the vertex, use directly the WTI:

$$(k_2 - k_1)_\mu \Gamma_R^\mu(k_2, k_1, \zeta) = iS_R^{-1}(k_2, \zeta) - iS_R^{-1}(k_1, \zeta)$$

→ build the vertex from the propagator instead of the scattering kernel

- Instead of using the DSE to build the vertex, use directly the WTI:

$$(k_2 - k_1)_\mu \Gamma_R^\mu(k_2, k_1, \zeta) = iS_R^{-1}(k_2, \zeta) - iS_R^{-1}(k_1, \zeta)$$

→ build the vertex from the propagator instead of the scattering kernel

- The idea behind the use of the Ball-Chiu vertex:

$$\begin{aligned} \Gamma_R^\mu(k_2, k_1, \zeta) &= \Gamma_{BC}^\mu(k_2, k_1, \zeta) + \Gamma_T^\mu(k_2, k_1, \zeta) \\ &= \underbrace{\sum_{i=1}^4 \lambda_i^\mu(k_2, k_1) F_i(k_2, k_1, \zeta)}_{\text{Fully determined by the WTI}} + \sum_{j=1}^8 \tau_j^\mu(k_2, k_1) F_j^T(k_2, k_1, \zeta) \end{aligned}$$

J. Ball and T.-W. Chiu, PRD 22 (1980) 2550

- Instead of using the DSE to build the vertex, use directly the WTI:

$$(k_2 - k_1)_\mu \Gamma_R^\mu(k_2, k_1, \zeta) = iS_R^{-1}(k_2, \zeta) - iS_R^{-1}(k_1, \zeta)$$

→ build the vertex from the propagator instead of the scattering kernel

- The idea behind the use of the Ball-Chiu vertex:

$$\begin{aligned} \Gamma_R^\mu(k_2, k_1, \zeta) &= \Gamma_{BC}^\mu(k_2, k_1, \zeta) + \cancel{\Gamma_T^\mu(k_2, k_1, \zeta)} \\ &= \underbrace{\sum_{i=1}^4 \lambda_i^\mu(k_2, k_1) F_i(k_2, k_1, \zeta)}_{\text{Fully determined by the WTI}} + \cancel{\sum_{j=1}^8 \tau_j^\mu(k_2, k_1) F_j^\top(k_2, k_1, \zeta)} \end{aligned}$$

J. Ball and T.-W. Chiu, PRD 22 (1980) 2550

Ball-Chiu approximation: $\Gamma_R^\mu(k_2, k_1, \zeta) = \Gamma_{BC}^\mu(k_2, k_1, \zeta)$

- Detailed structure of the BC vertex:

$$\lambda_1^\mu = \frac{\gamma^\mu}{2} \quad \rightarrow \quad F_1(k_2, k_1, \zeta) = 2 - \mathcal{A}_R(k_2^2, \zeta^2) - \mathcal{A}_R(k_1^2, \zeta^2)$$

$$\lambda_2^\mu = -\frac{k_1 + k_2}{2} (k_1 + k_2)^\mu \quad \rightarrow \quad F_2(k_2, k_1, \zeta) = \frac{\mathcal{A}_R(k_2^2, \zeta^2) - \mathcal{A}_R(k_1^2, \zeta^2)}{k_2^2 - k_1^2}$$

$$\lambda_3^\mu = -(k_2 + k_1)^\mu \quad \rightarrow \quad F_3(k_2, k_1, \zeta) = \frac{\mathcal{B}_R(k_2^2, \zeta^2) - \mathcal{B}_R(k_1^2, \zeta^2)}{k_2^2 - k_1^2}$$

$$\lambda_4^\mu = (k_1 + k_2)_\nu \sigma^{\mu\nu} \quad \rightarrow \quad F_4(k_2, k_1, \zeta) = 0$$

- Detailed structure of the BC vertex:

$$\lambda_1^\mu = \frac{\gamma^\mu}{2} \quad \rightarrow \quad F_1(k_2, k_1, \zeta) = 2 - \mathcal{A}_R(k_2^2, \zeta^2) - \mathcal{A}_R(k_1^2, \zeta^2)$$

$$\lambda_2^\mu = -\frac{k_1 + k_2}{2} (k_1 + k_2)^\mu \quad \rightarrow \quad F_2(k_2, k_1, \zeta) = \frac{\mathcal{A}_R(k_2^2, \zeta^2) - \mathcal{A}_R(k_1^2, \zeta^2)}{k_2^2 - k_1^2}$$

$$\lambda_3^\mu = -(k_2 + k_1)^\mu \quad \rightarrow \quad F_3(k_2, k_1, \zeta) = \frac{\mathcal{B}_R(k_2^2, \zeta^2) - \mathcal{B}_R(k_1^2, \zeta^2)}{k_2^2 - k_1^2}$$

$$\lambda_4^\mu = (k_1 + k_2)_\nu \sigma^{\mu\nu} \quad \rightarrow \quad F_4(k_2, k_1, \zeta) = 0$$

- Recalling the Nakanishi representation:

$$\mathcal{A}_R(p^2, \zeta^2) = (\zeta^2 - p^2) \int_0^\infty ds \frac{\rho_A(s, \zeta^2)}{(p^2 - s + i\epsilon)(\zeta^2 - s)}$$

- Detailed structure of the BC vertex:

$$\lambda_1^\mu = \frac{\gamma^\mu}{2} \rightarrow F_1(k_2, k_1, \zeta) = 2 - \mathcal{A}_R(k_2^2, \zeta^2) - \mathcal{A}_R(k_1^2, \zeta^2)$$

$$\lambda_2^\mu = -\frac{k_1 + k_2}{2} (k_1 + k_2)^\mu \rightarrow F_2(k_2, k_1, \zeta) = \frac{\mathcal{A}_R(k_2^2, \zeta^2) - \mathcal{A}_R(k_1^2, \zeta^2)}{k_2^2 - k_1^2}$$

$$\lambda_3^\mu = -(k_2 + k_1)^\mu \rightarrow F_3(k_2, k_1, \zeta) = \frac{\mathcal{B}_R(k_2^2, \zeta^2) - \mathcal{B}_R(k_1^2, \zeta^2)}{k_2^2 - k_1^2}$$

$$\lambda_4^\mu = (k_1 + k_2)_\nu \sigma^{\mu\nu} \rightarrow F_4(k_2, k_1, \zeta) = 0$$

- Recalling the Nakanishi representation:

$$\mathcal{A}_R(p^2, \zeta^2) = (\zeta^2 - p^2) \int_0^\infty ds \frac{\rho_A(s, \zeta^2)}{(p^2 - s + i\epsilon)(\zeta^2 - s)}$$

we obtain a vertex which

- ▶ **by construction** fulfil the WTI $\rightarrow \Pi_R^{\mu\nu}$ is transverse and finite
- ▶ depends **only** on the fermion self energy \rightarrow the system is closed
- ▶ allow algebraic manipulation of the momenta degrees of freedom

$$\begin{aligned} \Pi_R(\zeta, \zeta_p; q) &= -iZ_1(\zeta, \Lambda) \frac{4}{3} e_R^2 \int_{\Lambda} \frac{d^4 k}{(2\pi)^4} \mathcal{P}_{\mu\nu} \frac{1}{4} \text{Tr} \left[\gamma^\mu S_R(\zeta, k) \right. \\ &\quad \left. \times \left\{ \frac{1}{q^2} \Gamma_{BC}^\nu(\zeta, k, q) S_R(\zeta, k - q) - \frac{1}{\zeta_p^2} [\Gamma_{BC}^\nu(\zeta, k, q) S_R(\zeta, k - q)]_{q^2 = \zeta_p^2} \right\} \right] \\ \Sigma_R(\zeta; p) &= -iZ_1(\zeta, \Lambda) e_R^2 \int_{\Lambda} \frac{d^4 k}{(2\pi)^4} \gamma^\beta S_R(\zeta, k) \\ &\quad \times \left\{ D_{\beta\alpha}^R(\zeta, p - k) \Gamma_{BC}^\alpha(\zeta; k, p) - [D_{\beta\alpha}^R(\zeta, p - k) \Gamma_{BC}^\alpha(\zeta; k, p)]_{p^2 = \zeta^2} \right\} \end{aligned}$$

$$\Pi_R(\zeta, \zeta_p; q) = -iZ_1(\zeta, \Lambda) \frac{4}{3} e_R^2 \int_{\Lambda} \frac{d^4 k}{(2\pi)^4} \mathcal{P}_{\mu\nu} \frac{1}{4} \text{Tr} \left[\gamma^\mu S_R(\zeta, k) \right. \\ \left. \times \left\{ \frac{1}{q^2} \Gamma_{BC}^\nu(\zeta, k, q) S_R(\zeta, k - q) - \frac{1}{\zeta_p^2} [\Gamma_{BC}^\nu(\zeta, k, q) S_R(\zeta, k - q)]_{q^2 = \zeta_p^2} \right\} \right]$$

$$\Sigma_R(\zeta; p) = -iZ_1(\zeta, \Lambda) e_R^2 \int_{\Lambda} \frac{d^4 k}{(2\pi)^4} \gamma^\beta S_R(\zeta, k) \\ \times \left\{ D_{\beta\alpha}^R(\zeta, p - k) \Gamma_{BC}^\alpha(\zeta; k, p) - [D_{\beta\alpha}^R(\zeta, p - k) \Gamma_{BC}^\alpha(\zeta; k, p)]_{p^2 = \zeta^2} \right\}$$

$\Sigma_R(\zeta; p)$ becomes logarithmically divergent !

$$\begin{aligned} \Pi_R(\zeta, \zeta_p; q) &= -iZ_1(\zeta, \Lambda) \frac{4}{3} e_R^2 \int_{\Lambda} \frac{d^4 k}{(2\pi)^4} \mathcal{P}_{\mu\nu} \frac{1}{4} \text{Tr} \left[\gamma^\mu S_R(\zeta, k) \right. \\ &\quad \left. \times \left\{ \frac{1}{q^2} \Gamma_{BC}^\nu(\zeta, k, q) S_R(\zeta, k - q) - \frac{1}{\zeta_p^2} [\Gamma_{BC}^\nu(\zeta, k, q) S_R(\zeta, k - q)]_{q^2 = \zeta_p^2} \right\} \right] \\ \Sigma_R(\zeta; p) &= -iZ_1(\zeta, \Lambda) e_R^2 \int_{\Lambda} \frac{d^4 k}{(2\pi)^4} \gamma^\beta S_R(\zeta, k) \\ &\quad \times \left\{ D_{\beta\alpha}^R(\zeta, p - k) \Gamma_{BC}^\alpha(\zeta; k, p) - [D_{\beta\alpha}^R(\zeta, p - k) \Gamma_{BC}^\alpha(\zeta; k, p)]_{p^2 = \zeta^2} \right\} \end{aligned}$$

$\Sigma_R(\zeta; p)$ becomes logarithmically divergent !

Where do these new singularities come from?

$$F_1(k, p, \zeta) = 2 - \mathcal{A}_R(k^2, \zeta^2) - \underbrace{\mathcal{A}_R(p^2, \zeta^2)}_{\rightarrow 0 \text{ when } p^2 \rightarrow \zeta^2}$$

→ some logarithmic singularities are not subtracted by our renormalisation procedure

- Is this a problem with our renormalisation condition $\mathcal{A}_R(\zeta^2, \zeta^2) = 0$?
→ no, if $\mathcal{A}_R(\zeta^2, \zeta^2) \neq 0$ the singularities do not compensate

- Is this a problem with our renormalisation condition $\mathcal{A}_R(\zeta^2, \zeta^2) = 0$?
→ no, if $\mathcal{A}_R(\zeta^2, \zeta^2) \neq 0$ the singularities do not compensate
- The problem is actually known since the work of M. Pennington and D. Curtis → the BC vertex is inconsistent with multiplicative renormalisation

D. Curtis and M. Pennington, PRD 42, 1990, 4165-4169

- Is this a problem with our renormalisation condition $\mathcal{A}_R(\zeta^2, \zeta^2) = 0$?
→ no, if $\mathcal{A}_R(\zeta^2, \zeta^2) \neq 0$ the singularities do not compensate
- The problem is actually known since the work of M. Pennington and D. Curtis → the BC vertex is inconsistent with multiplicative renormalisation

D. Curtis and M. Pennington, PRD 42, 1990, 4165-4169

- This issue can be fixed using Γ_T^μ

$$\Gamma_{PC}^\mu(\zeta; k, p) = \Gamma_{BC}^\mu(\zeta; k, p) + \tau_6^\mu F_{6;PC}^T(k^2, p^2, \zeta^2)$$

- Is this a problem with our renormalisation condition $\mathcal{A}_R(\zeta^2, \zeta^2) = 0$?
→ no, if $\mathcal{A}_R(\zeta^2, \zeta^2) \neq 0$ the singularities do not compensate
- The problem is actually known since the work of M. Pennington and D. Curtis → the BC vertex is inconsistent with multiplicative renormalisation

D. Curtis and M. Pennington, PRD 42, 1990, 4165-4169

- This issue can be fixed using Γ_T^μ

$$\Gamma_{PC}^\mu(\zeta; k, p) = \Gamma_{BC}^\mu(\zeta; k, p) + \tau_6^\mu F_{6;PC}^T(k^2, p^2, \zeta^2)$$

- Solution to the issue is not unique → constraints on the purely transverse components to fulfil multiplicative renormalisation

A. Bashir *et al.*, PRC 85, 045205 (2012)

- Lesser known transverse WTIs ($q = k - p, t = k + p$):

$$\begin{aligned}
 q_\mu \Gamma_\nu(k, p) - q_\nu \Gamma_\mu(k, p) &= S^{-1}(p) \sigma_{\mu\nu} + \sigma_{\mu\nu} S^{-1}(k) \\
 &\quad + 2im \Gamma_{\mu\nu}(k, p) + t_\lambda \epsilon_{\lambda\mu\nu\rho} \Gamma_\rho^A(k, p) + A_{\mu\nu}^V(k, p) \\
 q_\mu \Gamma_\nu^A(k, p) - q_\nu \Gamma_\mu^A(k, p) &= S^{-1}(p) \gamma_5 \sigma_{\mu\nu} + \gamma_5 \sigma_{\mu\nu} S^{-1}(k) \\
 &\quad + t^\lambda \epsilon_{\lambda\mu\nu\rho} \Gamma^\rho(k, p) + V_{\mu\nu}^A(k, p)
 \end{aligned}$$

- Neglecting higher N -point functions, the Qin *et al.* truncation yields:

$$F_3^T(k, p) = -\frac{\mathcal{A}_R(k^2) - \mathcal{A}_R(p^2)}{2(k^2 - p^2)}$$

$$F_5^T(k, p) = \frac{\mathcal{B}_R(k^2) - \mathcal{B}_R(p^2)}{(k^2 - p^2)}$$

$$F_8^T(k, p) = \frac{\mathcal{A}_R(k^2) - \mathcal{A}_R(p^2)}{(k^2 - p^2)}$$

$$F_j^T(k, p) = 0 \quad \text{for } j \neq (3, 5, 8)$$

This is *not* a standard vertex truncation:

- it does *not* involve any “graph” discussion (ladder, cross-ladder, ...)
- it purely relies on *symmetry* considerations

- Impact of the Qin vertex :

- ▶ $F_3^T(k, p)$ and $F_8^T(k, p)$ **together** cure the BC vertex
→ we get both Σ_R and Π_R finite !
- ▶ $F_5^T(k, p)$ is not considered here → it might create troubles

A. Bashir et al., PRC 85, 045205 (2012)

- Impact of the Qin vertex :

- ▶ $F_3^T(k, p)$ and $F_8^T(k, p)$ **together** cure the BC vertex
→ we get both Σ_R and Π_R finite !
- ▶ $F_5^T(k, p)$ is not considered here → it might create troubles

A. Bashir *et al.*, PRC 85, 045205 (2012)

- Summarising, on the 12 independent structures, we get:

- ▶ 3 are exactly and purely given in terms of Σ_R
- ▶ 1 is exactly zero
- ▶ 3 are approximately given in terms of Σ_R only
- ▶ 5 are neglected

- Impact of the Qin vertex :
 - ▶ $F_3^T(k, p)$ and $F_8^T(k, p)$ **together** cure the BC vertex
→ we get both Σ_R and Π_R finite !
 - ▶ $F_5^T(k, p)$ is not considered here → it might create troubles
A. Bashir et al., PRC 85, 045205 (2012)
 - Summarising, on the 12 independent structures, we get:
 - ▶ 3 are exactly and purely given in terms of Σ_R
 - ▶ 1 is exactly zero
 - ▶ 3 are approximately given in terms of Σ_R only
 - ▶ 5 are neglected
- The Qin vertex is a long way from the tree-level one
 - The symmetries are merciless → they determine the truncation

Abelian DSEs in Minkowski space

Coupled equations for Nakanishi weights

$$\begin{aligned}
 \Pi_R(\zeta, \zeta_p; q) &= -iZ_1(\zeta, \Lambda) \frac{4}{3} e_R^2 \int_{\Lambda} \frac{d^4 k}{(2\pi)^4} \mathcal{P}_{\mu\nu} \frac{1}{4} \text{Tr} \left[\gamma^\mu S_R(\zeta, k) \right. \\
 &\quad \left. \times \left\{ \frac{1}{q^2} \Gamma_Q^\nu(\zeta, k, q) S_R(\zeta, k - q) - \frac{1}{\zeta_p^2} [\Gamma_Q^\nu(\zeta, k, q) S_R(\zeta, k - q)]_{q^2 = \zeta_p^2} \right\} \right] \\
 \Sigma_R(\zeta; p) &= -iZ_1(\zeta, \Lambda) e_R^2 \int_{\Lambda} \frac{d^4 k}{(2\pi)^4} \gamma^\beta S_R(\zeta, k) \\
 &\quad \times \left\{ D_{\beta\alpha}^R(\zeta, p - k) \Gamma_Q^\alpha(\zeta; k, p) - [D_{\beta\alpha}^R(\zeta, p - k) \Gamma_Q^\alpha(\zeta; k, p)]_{p^2 = \zeta^2} \right\}
 \end{aligned}$$

$$\Pi_R(\zeta, \zeta_p; q) = -iZ_1(\zeta, \Lambda) \frac{4}{3} e_R^2 \int_{\Lambda} \frac{d^4 k}{(2\pi)^4} \mathcal{P}_{\mu\nu} \frac{1}{4} \text{Tr} \left[\gamma^\mu S_R(\zeta, k) \right. \\ \left. \times \left\{ \frac{1}{q^2} \Gamma_Q^\nu(\zeta, k, q) S_R(\zeta, k - q) - \frac{1}{\zeta_p^2} [\Gamma_Q^\nu(\zeta, k, q) S_R(\zeta, k - q)]_{q^2 = \zeta_p^2} \right\} \right]$$

$$\Sigma_R(\zeta; p) = -iZ_1(\zeta, \Lambda) e_R^2 \int_{\Lambda} \frac{d^4 k}{(2\pi)^4} \gamma^\beta S_R(\zeta, k) \\ \times \left\{ D_{\beta\alpha}^R(\zeta, p - k) \Gamma_Q^\alpha(\zeta; k, p) - [D_{\beta\alpha}^R(\zeta, p - k) \Gamma_Q^\alpha(\zeta; k, p)]_{p^2 = \zeta^2} \right\}$$

- Straightforward, albeit tedious, steps:

- ▶ replace $\Pi_R, \mathcal{A}_R, \mathcal{B}_R$ with their Nakanishi representations
- ▶ replace S_R and D_R with their Källen-Lehmann representations
- ▶ reduce the rhs to the same denominator through the Feynman trick
- ▶ integrate over k for p and q spacelike

$$\Pi_R(\zeta, \zeta_p; q) = -iZ_1(\zeta, \Lambda) \frac{4}{3} e_R^2 \int_{\Lambda} \frac{d^4 k}{(2\pi)^4} \mathcal{P}_{\mu\nu} \frac{1}{4} \text{Tr} \left[\gamma^\mu S_R(\zeta, k) \right. \\ \left. \times \left\{ \frac{1}{q^2} \Gamma_Q^\nu(\zeta, k, q) S_R(\zeta, k - q) - \frac{1}{\zeta_p^2} [\Gamma_Q^\nu(\zeta, k, q) S_R(\zeta, k - q)]_{q^2 = \zeta_p^2} \right\} \right]$$

$$\Sigma_R(\zeta; p) = -iZ_1(\zeta, \Lambda) e_R^2 \int_{\Lambda} \frac{d^4 k}{(2\pi)^4} \gamma^\beta S_R(\zeta, k) \\ \times \left\{ D_{\beta\alpha}^R(\zeta, p - k) \Gamma_Q^\alpha(\zeta; k, p) - [D_{\beta\alpha}^R(\zeta, p - k) \Gamma_Q^\alpha(\zeta; k, p)]_{p^2 = \zeta^2} \right\}$$

- Straightforward, albeit tedious, steps:
 - ▶ replace $\Pi_R, \mathcal{A}_R, \mathcal{B}_R$ with their Nakanishi representations
 - ▶ replace S_R and D_R with their Källen-Lehmann representations
 - ▶ reduce the rhs to the same denominator through the Feynman trick
 - ▶ integrate over k for p and q spacelike
- Less straightforward steps:
 - ▶ rearrange the rhs and perform the proper change of variable to obtain the same structure of external momentum than the lhs
 - ▶ finally use the unicity of the Nakanishi representation to identify the gap equation fulfilled by the weight

- The Nakanishi representations yield:

$$\begin{aligned}\Pi_R(\zeta, \zeta_p; q) &= (\zeta_p^2 - q^2) \int_{s_{th}^p}^{\infty} ds \frac{\rho_\gamma(s, \zeta^2)}{(q^2 - s + i\epsilon)(\zeta_p^2 - s)} \\ \Sigma_R(\zeta; q) &= (\zeta^2 - p^2) \int_{s_{th}^p}^{\infty} ds \frac{\not{p}\rho_A(s, \zeta^2) + \rho_B(s, \zeta^2)}{(p^2 - s + i\epsilon)(\zeta^2 - s)}\end{aligned}$$

- The Nakanishi representations yield:

$$\Pi_R(\zeta, \zeta_p; q) = (\zeta_p^2 - q^2) \int_{s_{th}^p}^{\infty} ds \frac{\rho_\gamma(s, \zeta^2)}{(q^2 - s + i\epsilon)(\zeta_p^2 - s)}$$
$$\Sigma_R(\zeta; q) = (\zeta^2 - p^2) \int_{s_{th}^p}^{\infty} ds \frac{\not{p}\rho_A(s, \zeta^2) + \rho_B(s, \zeta^2)}{(p^2 - s + i\epsilon)(\zeta^2 - s)}$$

- In the self-energy loop of the DSEs:
 - ▶ potentially 6 unbounded integration variables (ρ and σ)
 - ▶ various number of Feynman parameters
- many integration parameters needs to be rearranged

- The Nakanishi representations yield:

$$\Pi_R(\zeta, \zeta_p; q) = (\zeta_p^2 - q^2) \int_{s_{th}^p}^{\infty} ds \frac{\rho_\gamma(s, \zeta^2)}{(q^2 - s + i\epsilon)(\zeta_p^2 - s)}$$

$$\Sigma_R(\zeta; q) = (\zeta^2 - p^2) \int_{s_{th}^p}^{\infty} ds \frac{\not{p}\rho_A(s, \zeta^2) + \rho_B(s, \zeta^2)}{(p^2 - s + i\epsilon)(\zeta^2 - s)}$$

- In the self-energy loop of the DSEs:

- ▶ potentially 6 unbounded integration variables (ρ and σ)
- ▶ various number of Feynman parameters

→ many integration parameters needs to be rearranged

- one needs to get the *same* denominator power

- ▶ achieve through appropriate change of variable and integration on specific variables
- ▶ or obtained through integration by parts

$$\begin{aligned}
 \Theta(y - s_{th}) \rho_A(y, \zeta) &= \frac{3}{(4\pi)^2} e_R^2 \lim_{\Lambda \rightarrow \infty} Z_1(\zeta, \Lambda) \int_0^\infty d\omega \bar{\sigma}_\gamma(\omega, \zeta, \zeta_p, \Lambda) \int_0^1 d\xi \int_0^\infty ds' \\
 &\quad \left\{ \bar{\sigma}_V(s', \zeta, s'_{th}, \Lambda) \left[\xi \Theta(y\xi(1-\xi) - \xi\omega - (1-\xi)s') \right. \right. \\
 &\quad \left. \left. - \int_0^{1-\xi} dt \Theta(yt(1-t) - \xi\omega - ts') \right] + \bar{\sigma}_V(s', \zeta, s'_{th}, \Lambda) \right. \\
 &\quad \times \left[\int_{s_{th}}^\infty ds \rho_A(s, \zeta, \Lambda) \mathcal{C}_{AV}^{(0)}(\zeta, \omega, s, s', \xi, y) \right. \\
 &\quad \left. + y \int_{s_{th}}^\infty ds \rho_A(s, \zeta, \Lambda) \mathcal{C}_{AV}^{(1)}(\zeta, \omega, s, s', \xi, y) \right] \\
 &\quad - y \bar{\sigma}_S(s', \zeta, s'_{th}, \Lambda) \int_0^{1-\xi} dt \int_0^{1-\xi-t} dw \\
 &\quad \times \left. \int_{s_{th}}^\infty ds \rho_B(s, \zeta, \Lambda) \Delta' \left[y - s + \frac{s\mathcal{A}_4(t, w) - \xi\omega - ts' - ws}{\mathcal{A}_4(t, w)} \right] \right\}
 \end{aligned}$$

Recovering the 1-loop results I

Nakanishi weights

$$\Theta(y - s_{th}) \rho_A^{(1)}(y, \zeta) = -\frac{e_R^2}{2(4\pi)^2} \frac{1}{\zeta_p^2 y^2} \Theta(y - m^2) \left\{ \Theta\left[[m + \zeta_p]^2 - y \right] (y - m^2)^3 \right. \\ \left. + \Theta\left[y - [m + \zeta_p]^2 \right] (y - m^2)^3 \left[1 - f(y, \zeta, \zeta_p^2) \right] \right\},$$

$$f(y, \zeta^2, \zeta_p^2) = \sqrt{1 - \zeta_p^2} \frac{2y + 2m^2 - \zeta_p^2}{(y - m^2)^2} \left[1 + \zeta_p^2 \frac{y + m^2 - 2\zeta_p^2}{(y - m^2)^2} \right],$$

$$\Theta(y - s_{th}) \rho_B^{(1)}(y, \zeta) = -\frac{3e_R^2}{(4\pi)^2} \Theta\left[y - [m + \zeta_p]^2 \right] \frac{m}{y} \sqrt{[y - m^2 - \zeta_p^2]^2 - 4m^2 \zeta_p^2}$$

$$\Theta(y - s_{th}^p) \rho_\gamma^{(1)}(y, \zeta) = -\frac{e_R^2}{3(2\pi)^2} \Theta(y) \Theta(y - 4m^2) \left(1 + 2\frac{m^2}{y} \right) \sqrt{1 - 4\frac{m^2}{y}}$$

- Expected behaviour for $\zeta_p \rightarrow 0$
- Expected behaviour for $y \rightarrow \infty$

Recovering the 1-loop results II

Källén-Lehmann weights

- The Källén-Lehmann weights behave as expected:
 - ▶ rapid increase from threshold, reach maximum and slowly go to zero at infinity
 - ▶ for fermions, IR divergences noticeable

Truncation of the gap equations

- Getting a workable and consistent truncation is **not** easy
- In particular, the bare vertex cannot be used in the photon case
- We learn a great deal on the impact of the symmetries on the interaction
- In the end, the symmetries leave us **no choice** but working with the Q_{in} vertex as a “minimal” vertex

Minkowski space computation

- From the Q_{in} vertex, Källen-Lehmann and Nakanishi representations allows us to handle the momenta algebraically
- We obtained 6 coupled and non-linear equations for six unknown functions
- We checked that we recover expected one-loop results

Perspectives

Scheme dependence

- Check whether things hold in the standard on-shell schemes
- Modification should be of a finite amount despite mixing \mathcal{A} and \mathcal{B}

Gauge dependence

- Open question: does the framework hold in the lightcone gauge ?
- Algebraic momentum dependence: we can expect that yes
→ good news to compute lightcone quantities (PDFs, GPDs, ...)

Numerical effort

- Is the framework workable numerically speaking?
- All final integral are finite, but it does not mean the system will converge toward a solution

- Naive idea: plug the results of our equations in the BSE:

with some Ansatz for the scattering kernel K

- Naive idea: plug the results of our equations in the BSE:

with some Ansatz for the scattering kernel K

- My guess: it will **not** work.

- Naive idea: plug the results of our equations in the BSE:

with some Ansatz for the scattering kernel K

- My guess: it will **not** work.
- Necessary to develop a kernel consistent with Γ_Q^μ

D. Binosi *et al.*, PRD 93 (2016) 9, 096010
S.-X. Qin and C.D. Roberts, arXiv:2009.13637

D. Binosi *et al.*, PRD 93 (2016) 9, 096010
 S.-X. Qin and C.D. Roberts, arXiv:2009.13637

Once again, the symmetries will dictate the structure of the kernel
 → this needs to be worked out in our case

Modification in QCD

- KL representation not proved but compatible with lattice results
- Nakanishi \rightarrow pQCD working at large p , so representation valid with modification of the singularities (e.g. complex conjugate poles)?
- WTI are replaced by STI. Non-abelian BC vertex available (quarks-gluon and 3-gluons cases).

D. Binosi and R.-A. Tripolt, PLB 801 (2020) 135171

A.C. Aguilar *et al.*, PRD 98 (2018) 1, 014002

A.C. Aguilar *et al.*, PRD 99 (2019) 3, 034026

A.C. Aguilar *et al.*, Phys.Rev.D 99 (2019) 9, 094010

- Up to my knowledge, no equivalent of the tWTIs have been derived

Extension to QCD relies on progresses on the gauge constraints on the 3-point and 4-point functions entering the gap equations.

Thank you for your attention
