Feb 12-14, 2025, Jeongseon, Korea

# Outlines

1. Neutron Particle and It's Properties
2. Neutron Detection Principle
3. Scintillators for Thermal Neutron Detection
4. Scintillators for Fast Neutron Detection
5. Future Research

# 1. Neutron Particle and It's Properties

- The neutron is a subatomic particle, that has no electric charge, and a mass slightly greater than that of a proton.
- Protons and neutrons constitute the nuclei of atoms.

Lifetime:

- Bottle method (cold neutron): 877.75 s
- Beam method (hot neutron) : 887.7 s

Reason = unknow!

Mass	$1.675 \times 10^{-27}$ kg
Charge	0
Spin	1/2
Magnetic moment	$-1.913\mu_N$ ( $\mu_N = 5.051 \times 10^{-27}$ JT <sup>-1</sup> is the nuclear magneton)

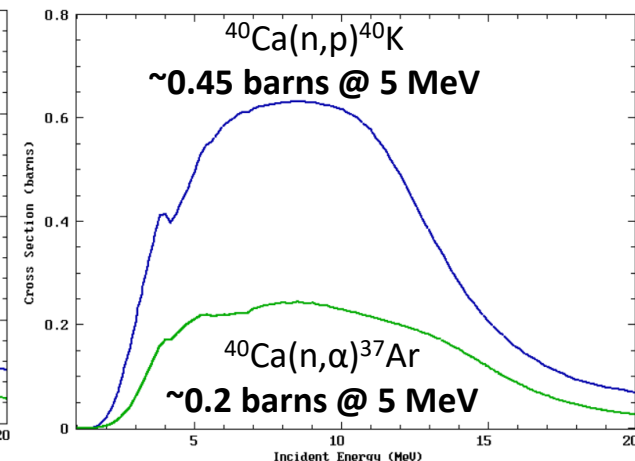

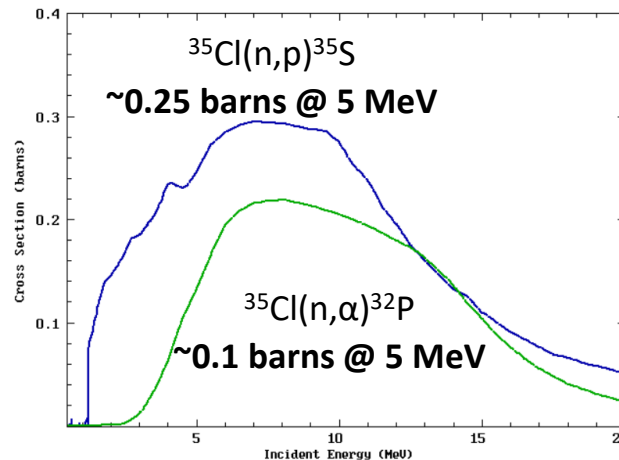

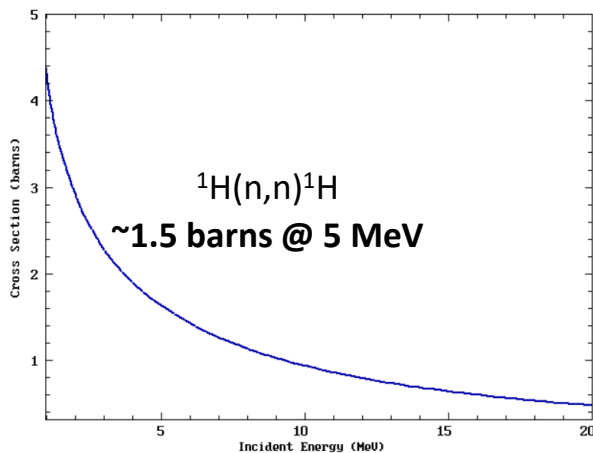

## 2. Neutron detection principle

Neutral charge => Direct detection is impossible, need converter via nuclear reactions

### Thermal neutron detection

- ${}^3\text{He}(n,p)$  ~**5316** barns, natural abundance ~1.37 ppm.
- ${}^6\text{Li}(n,t)$  ~**938** barns, natural abundance ~7.6 %.
- ${}^{10}\text{B}(n,\alpha)$  ~**3844** barns, natural abundance ~19.8 %.
- ${}^{113}\text{Cd}(n,\gamma)$  ~**19960** barns, natural abundance ~12.2 %.
- ${}^{235}\text{U}(n, \text{fission})$  ~**587** barns, natural abundance ~0.72 %.

Fast neutron detection  ~1000 times lower detection efficiency  
 Gamma rejection is typically required

### 3. Scintillators for thermal neutron detection

- $^3\text{He}(n,p)$  ~**5316** barns, natural abundance ~1.37 ppm.
- $^6\text{Li}(n,t)$  ~**938** barns, natural abundance ~7.6 %.
- $^{10}\text{B}(n,\alpha)$  ~**3844** barns, natural abundance ~19.8 %.
- $^{113}\text{Cd}(n,\gamma)$  ~**19960** barns, natural abundance ~12.2 %.
- $^{235}\text{U}(n, \text{fission})$  ~**587** barns, natural abundance ~0.72 %.

- $^6\text{Li}$ -based scintillators: LiF/ZnS:Ag, LiI:Ag,  $\text{Cs}_2\text{LiYCl}_6\text{:Ce}$ ,  $\text{LiCaAlF}_6$ , NaI, lithium-6 glass scintillators.
- $^{10}\text{B}$ -based scintillators: Borosilicate glass scintillators,  $\text{B}_2\text{O}_3/\text{ZnS:Ag}$ , boron-loaded plastic scintillators.

Li-glass SG101

Boron-loaded plastic scintillators EJ-254

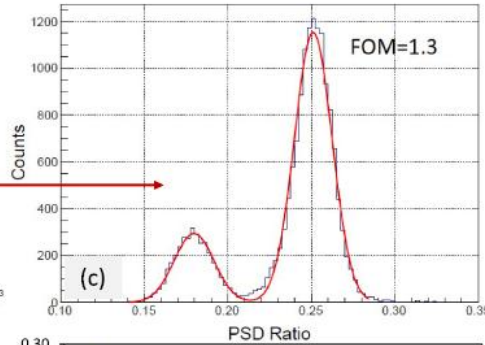

LiI:Ag

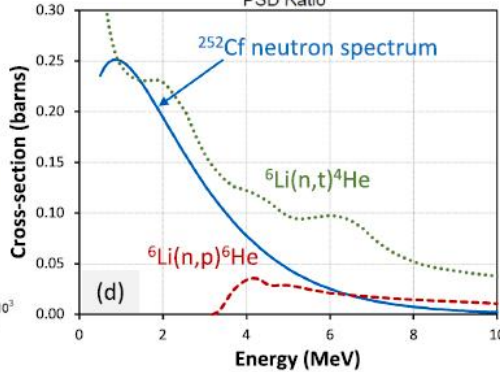

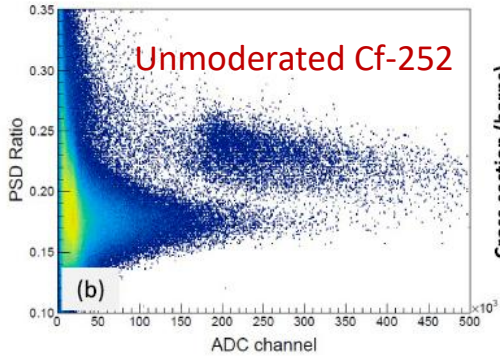

LiF/ZnS:Ag EJ-600

# 3.1 LiI:Ag

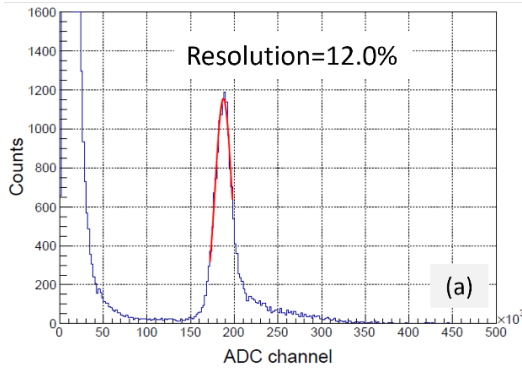

Moderated Cf-252

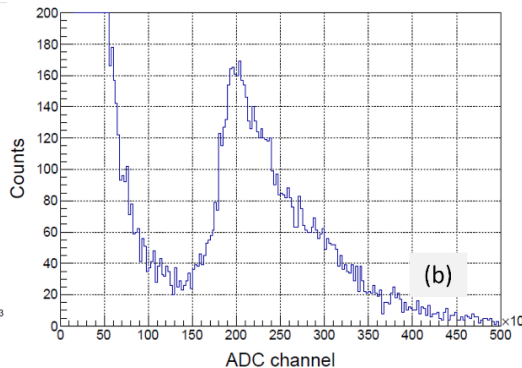

Unmoderated Cf-252

Type of particles	FOM
Gamma – neutron	1.3

Moderated Cf-252

Unmoderated Cf-252

Also sensitive to epithermal and fast neutrons

<https://doi.org/10.1038/s41598-024-85087-4>

# 4.2 CaF<sub>2</sub>

Type of particles	FOM
Gamma – Alpha	0.85

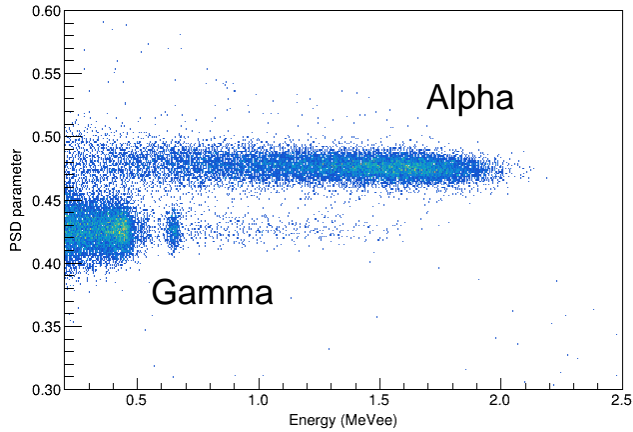

Type of particles	FOM
Gamma – Neutron	0.8

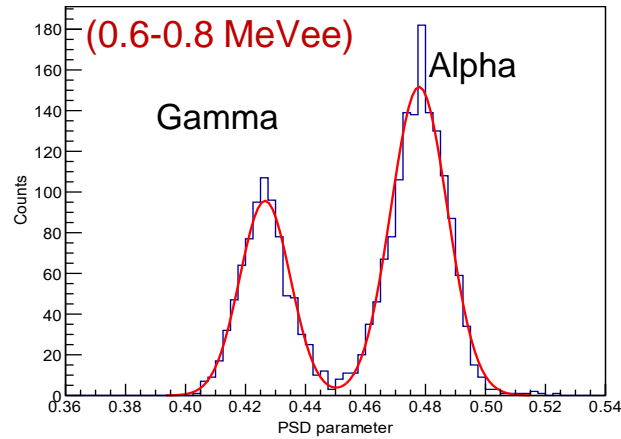

Basically from the (n,p) reaction

<https://doi.org/10.1016/j.radphyschem.2024.111756>

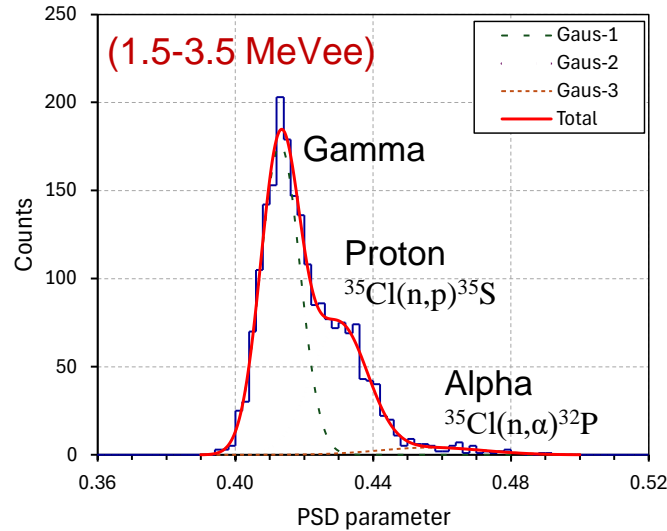

# 4.3 SrCl<sub>2</sub>

PSD diagram

Type of particles	FOM
Gamma – Alpha	1.23 ± 0.04

Type of particles	FOM
Gamma – Alpha	0.9 ± 0.3
Gamma – Proton	0.5 ± 0.1
Proton – Alpha	0.5 ± 0.3

## 5. Future Research

---

- ❑ Scintillation materials (Detectors and Dosimeters)
  - New Li-based scintillators
  - $\text{CaF}_2$ : neutron detection performance at low energy
  - $\text{LaCl}_3$ : Response function, spectrum unfolding
  - Stilbene and Plastic scintillators: Response function and unfolding performance
  - New Cl-based scintillators
  
- ❑ Detector development and Application
  - Spectrometers: neutron, muon, gamma, etc.
  - Radiography: neutron, muon, X-ray, etc.
  
- ❑ Physics
  - Cross-section
  - Mechanism

**Thank you for your attention!**
